Research Interests

Si Liu's research lies at the intersection of **formal methods**, **systems**, and **security**, with a strong focus on **leveraging formal verification techniques to build reliable, secure, and performant distributed systems**. In recent years, he has worked on verifying and validating both the **designs and deployments** of **databases** and **DNS**, addressing not only **qualitative** (e.g., reliability and security) but also **quantitative** (e.g., availability and scalability) aspects. He is also deeply interested in the **intersection of these areas with AI**: both in applying AI techniques to strengthen testing and verification, and in developing rigorous methods for verifying AI-powered systems themselves.
